

The Spec Is the New Schematic — Speaker Notes (v3)

John Carter, N6YU — RSGB Convention 2026 · ~35 min talk + Q&A

1 The Spec Is the New Schematic

A spec does for an AI-built program what a schematic does for a radio

- The title only hints at the talk; it is really about taking vibe coding to the next level.
- A schematic lets someone somewhat skilled understand and recreate a project.
- A spec does the same for software: it guides a builder. It is not a detailed description with PCB layout, testing, alignment, and a BOM.

2 Presentation on GitHub

Scan the QR code to get the presentation PDF from GitHub.

- The QR code opens the presentation PDF in the talk repo, github.com/jcarter-labs/rsgb-sdd-n6yu.
- The repo also has the Masterplan Generator. The links are repeated in the appendix (slide 19).

3 Remote Operation in Mojave Desert

Like many of us, I am plagued with local noise, so I like to get away. Really far away.

- Shows a camp in the setup process, late in the day arriving, tent not up, sun going down. 17' vertical whip behind
- The map shows roughly where in the Mojave 350 mi from home, 120 mi from LA, close to nothing but the desert town "Boron".
- I have Starlink and solar out there, but no bandscope. Just an older but excellent rig, the KX3. I really like bandscope.

4 Software Is Replacing Solder

AI coding is good enough for radio projects, but on its own it is neither repeatable nor structured.

- Tools and test: the soldering iron and scope on the older side; modules and software on the newer side. Storage: the file cabinet becomes GitHub.
- For a sense of how big radio software has become, look at a modern logger: rig control, internet, display, database, callsign lookup, propagation, and more.
- There are ways to get around the drawbacks

5 Key Terms

A small shared vocabulary is all you need to follow the rest of the talk.

- **Specs:** your app's features and behaviors, in plain language with testable numbers.
- **Masterplan:** the spec plus the rules, the tech choices, and the ordered tasks for building your app.
- **Masterplan Generator:** a document that guides you in writing a masterplan for your app. It makes complex software buildable without software-engineering skills.
- **SDD:** an AI-updated plan of record. The spec stays the source of truth as the code changes.

6 Why Did I Bother? A Poor Man's Panadapter

No existing tool combined a bandscope, POTA spots, and spotter selection, so I built one.

- I could tap the I/Q outputs and build a 50 kHz scope with FFT and display software, but that is a lot of hardware. What if I just listen to local spotters? Isn't that like a panadapter?
- POTA.APP shows maps and spots for hunting, but its interface prioritizes the map, not a bandscope.
- N1MM on Windows shows a bandscope, but not POTA spots.

7 Possible SDD Projects for Radio

SDD fits almost any shack project, from platform ports to Arduino builds to station control.

- This is a laundry list. SDD suits nearly anything.
- The screenshot is a keyer built from K6GTE's, ported from Linux to Mac.

8 Vibe Coding, Can Be Amazing!

Vibe coding nails the first 20% but leaves guessed assumptions, brittle code, and a lost chat.

- **POLL** How many of you have vibe coded?
- **POLL** How many of you have used GitHub?

9 A Better Alternative: SDD

This is the talk in one sentence

- More time up front, but faster and self documenting

10 Preliminaries: Claude Code & GitHub Setup

Claude is vastly more powerful than chat.

- Claude Code is now available in Claude Desktop (little toggle in upper left)
- **GitHub is a Superpower.** Claude can help you figure it out.

11 Masterplan Generator + Idea + Screenshot

This is the talk in one slide.

- The name is not special; call it anything. The contents are not unique either. The four sections come from best practices at many tech companies (Amazon, Anthropic, Microsoft).

12 Use Generator + Your Idea to Create a Masterplan

Constitution, Spec, Tech, Tasks: four steps from idea to a buildable plan.

- **Constitution (how we work): another Superpower.** Use the Generator's prompts as-is. These are ground rules, and they keep you out of vibing trouble.
- **Spec (what it does):** give Claude your app idea, and the Generator asks you questions to customize the spec. This is where the unknown unknowns come out.
- **Tech (built with):** If you don't know the answers, use Claude Desktop (or another Claude Code instance) to help fill it in.

13 Example: Idea + Screenshot → Masterplan Generator

A short idea plus one screenshot is enough input; the generator interviews you for the rest.

14 The Masterplan Generator (Download from Link in Appendix)

The generator lives on GitHub as plain, readable text anyone can open and reuse.

- Each prompt carries a label: RULE (follow it during the build), DRAFT (write this part now and show me), USER INPUT (ask me first).

15 Claude Code and Claude Desktop as Helper

Superpower: when Code's output is confusing, ask Desktop to explain and paste the answer back.

16 It Works! Multiplatform Screenshots

One spec produced the same working app on Mac, Windows, and Linux.

17 Conclusion

Vibe coding gets you started; the masterplan gets you finished, so start small with your own idea.

- Call back to the opening: like a schematic, the spec is what you keep and share.
- The QR code points to the GitHub repo for this talk, which has the Masterplan Generator and the presentation. Your first masterplan starts here.

18 Time for Your Road Trip! Your Idea (Questions?)

Close on the road-trip image and open the floor: Claude Code and GitHub are the transportation, your idea is the trip.

- Callback to slide 3: same desert trails. The idea is the destination, Claude Code and GitHub are the vehicle, and the spec is the plan you drive from.
- Invite questions. Leave this slide up through Q&A.
- Keep the slide numbers handy. Type a number to jump: **14** for the generator, **19** for the repo links, **20** for references, **23** for the DX Spotter feature list.
- If someone asks for the side-by-side of vibe coding and SDD, slide 22 is in the backup section.

APPENDIX

19 Appendix – GitHub Links

Everything shown today is in two repos, one for the talk and one for the app.

- Talk repo: `github.com/jcarter-labs/rsgb-sdd-n6yu` . It has the slides, the example masterplan, and the Masterplan Generator.
- Code repo: `github.com/jcarter-labs/dx-spotter-app` . It has the DX Spotter app.
- The QR codes on the slide point to each repo.
- Contact: John Carter, N6YU, `john@n6yu.com`, `github.com/jcarter-labs` .

20 Appendix – References

Where to go deeper on SDD and Claude Code.

21 Find out more... (closing)

How to reach me.

- John Carter, N6YU, john@n6yu.com, github.com/jcarter-labs.

BACKUP

These two slides sit after the closing slide in the deck. They are not in the main flow.

22 Vibe Prompt vs. SDD

SDD trades a slower start for tested, repeatable, shareable results you can change later.

- Give the AI the basic idea *plus a screenshot*, then have it build the spec, i.e. the masterplan.
- Walk the rows: Prompt, Details, Testing, Speed, Later.
- The honest cost is the Speed row: SDD has a slower start and more work up front. The payoff is the Later row: edit the spec, rebuild from GitHub, add features or change OS.

23 DX Spotter | The Working Result

The spec-built app works: live RBN bandmap, POTA hunting, and three cluster types.

- Bandmap: live RBN spots with an adjustable window, working (compared with N1MM).
- POTA.APP hunting view: working (compared with POTA.APP).
- Frequency, bandscope window width, and timeout menu.
- Spotter selection: Local (within about 50 miles) and Regional (within about 250 miles).
- Cluster server menu: three major server types supported.
- Status indication for the RBN and POTA servers.
- Out of scope today: DE (spotter) specification, CAT control, and a mobile UI.
- One build produced green spots for POTA, so I kept that one as the starter screenshot.
